Priorities

Cameleon's built-in arbitration system eliminates CCTV resource conflicts and allows operators to take exclusive control of specific devices.

Configurable Desktop

Customize the appearance of client workstations with Cameleon workspaces. Specify which windows are displayed, and their size, position and content on individual or multiple workstations. Multiple monitor configurations are fully supported.

Customizable Site Maps

Load site maps in any of several file formats and customize them with icons representing installed devices, alarms and automated events. Create hyperlinks with controllable transparency to navigate to additional maps and named views. Or for small systems, use the device tree instead of a site map.

Hybrid IP/Analog Video

View and control IP and analog video simultaneously through a single interface. Cameleon's state-of-the-art canvas technology allows you to migrate from your existing analog video system into the era of IP video gradually, without losing your investment.

Fluid PTZ Control

Cameleon's custom windows are live control pads. View video by dragging the camera icon from the map to the custom window. Move the mouse over the window to pan and tilt the camera, or use the mouse wheel to zoom, focus or adjust the iris.

Scalability

Scale up by adding servers and clients as needed. Cameleon supports client-server, client-multiple server and server-to-server architecture, allowing you to share video with other users while protecting the sensitive parts of your system configuration.

Device Gadgets

Device gadgets provide the operator with easy access to a device's advanced controls, camera presets, patterns and auxiliaries. Access the gadget for each device switched to the current window from the window's control bar.

Custom Windows

Cameleon's multi-purpose custom windows allow you to view live and archived video, load site maps, connect to and control remote PCs, or connect to the Internet via an integral browser window.
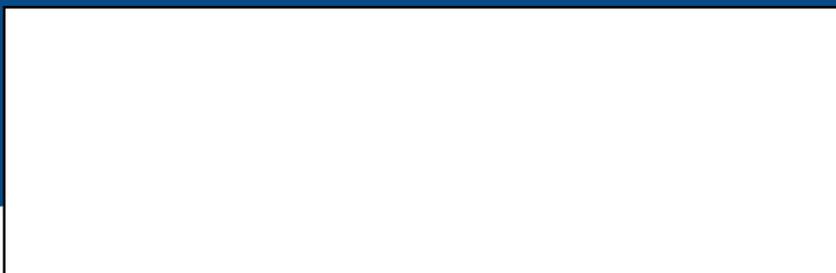

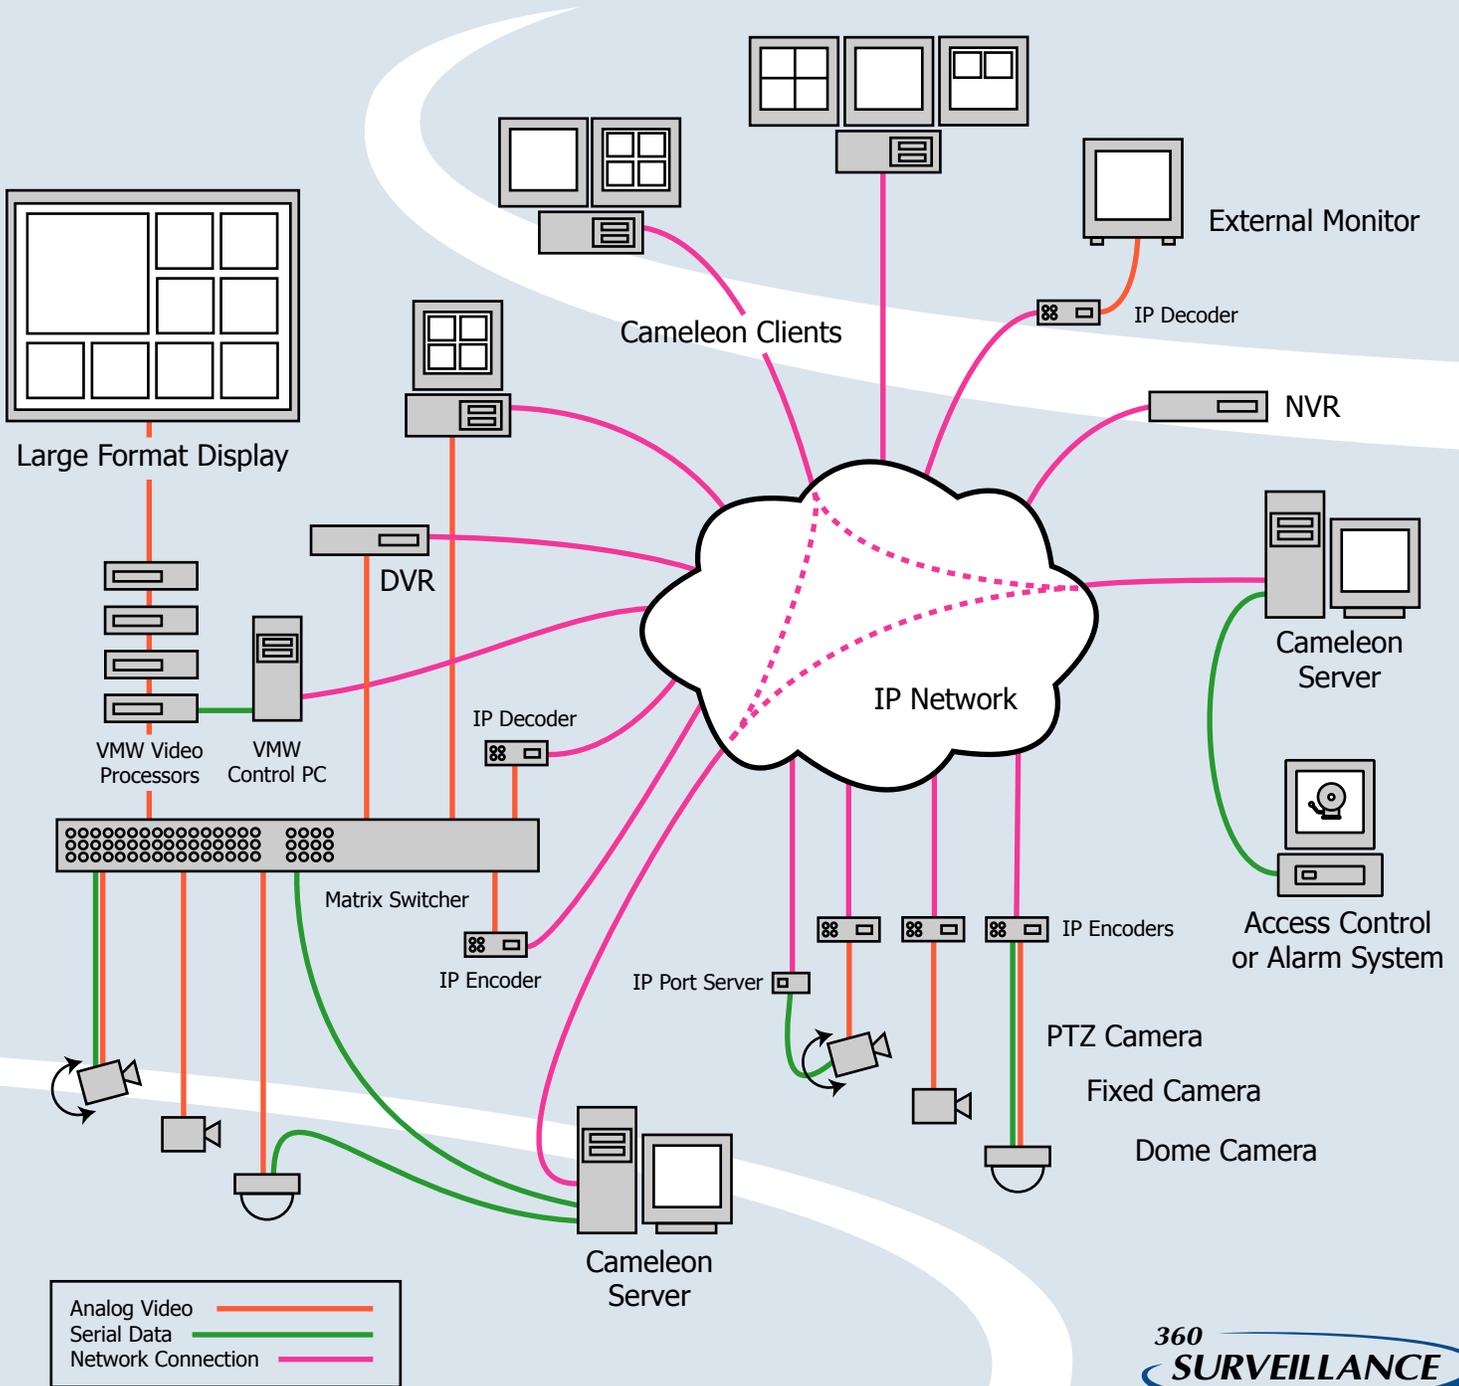

Advanced Automation

Cameleon's powerful scripting language allows you to automate common tasks and ensure the correct conditions exist before a particular action takes place. Design scripts to perform tasks in response to user control, conditions within the system, access or alarm input, or according to a schedule.

Multi-Vendor Support

Combine equipment from different manufacturers. Use Cameleon's intuitive interface to configure and control them all. Custom-developed device drivers allow you to seamlessly integrate legacy equipment with new equipment.

Access and Alarm Integration

Link external access control and alarm systems to Cameleon to create an integrated security system.

Archived Video

Archive video on network video recorders or DVRs. Use the same common interface to retrieve archived video, no matter what type of device it was recorded on.

Operator Security

Secure access to the system through operator passwords and access privileges. Granular permissions enable you to restrict an operator's access to each site map and device independently, as well as restricting access to a subset of a device's features.

Alarm Management

Cameleon's sophisticated alarm management system allows you to define automated actions to execute in response to an alarm. Broadcast notification to specified operators, or notify operators in turn to guarantee timely handling. Archive alarms for later retrieval using Cameleon's search and filter utility.

External Display Control

Cameleon provides operators with access to external monitors and monitor walls through simple drag-and-drop actions. Cameleon also supports the Virtual Monitor Wall, a large-format display that can be divided into multiple video monitors.
